Sustainable Investment Policy of Lankaran State University

The Investment Policy is reviewed annually by the Public Council and any suggested changes require Public Council's consent. There is a serious need for veterinarians, agronomists, ecologists, good teachers, economists, etc., therefore Lankaran State University makes serious efforts to train professional personnel who can meet those needs. As a result, Lankaran State University is a participant a number of international and regional events, which are aimed at ensuring that education covers climate change.

Over the past three years, Lankaran State University has made significant investments in sustainability efforts. The university has successfully digitized its document circulation system, Human Resources management system, Student Information System, and Learning Management System. This initiative aims to reduce paper usage, increase transaction speed, enhance transparency, and improve the overall quality of university processes. The Veterinary Clinic, invested in by Lankaran State University, began operations in December 2025. This clinic is the only modern veterinary clinic in the southern region.

Since 2020, both online and live classes have been conducted in collaboration with Kafkas University in Kars, Turkey. Additionally, faculty members from Kafkas University regularly visit Lankaran State University to provide practical experience to our Veterinary Medicine students. Moreover, our students are sent to Kafkas University for internship purposes. Lankaran State University invests in all of these initiatives. Our graduates will have the opportunity to continue their careers at this clinic, which will also serve as an active resource for farmers and private entrepreneurs in the southern region.

This initiative fosters a strong partnership between science and industry by providing comprehensive training to prospective graduates, preparing them for careers in this specialized sector. Research on ecology involving plants, animals, microorganisms and humans is being conducted and assessment of challenges for environmental monitoring, biodiversity conservation and bioresource is being conducted. In addition, Lankaran State University develops tea cultivation, plant breeding, and horticulture and tree nursery. Our university has its own river fields and tree plantations, which the University also invests in. By growing tree seedlings, we distribute these tree seedlings to the universities and organizations with which we cooperate and support the greening of the area. We hold "ecology days" with students about reducing carbon emissions.

At the same time, Lankaran State University has invested in reducing carbon emissions. Thus, in the "Seaside" hotel of the university, in the service apartments built for professors and teachers, 3 in the dormitories for male and female students, and in our other buildings, the use of natural gas is abandoned and electricity is used. The Public Council entrusted the investment control to Lankaran State University. The Public Council is not responsible for the mentioned issues.
